

Problems To Solve

1. Speed of the mechanical response
2. Seal on the sides
3. Price important; measure it against SPO.

Early Roadplan

- Fan sound will determine our goal of sound pressure loss (Brandon)
- Fan geometry (how the product will fit within) (Jaden)
 - This Friday-Sunday
- Figure out how many unit cells will be needed to hit this goal. Iteratively figure out unit cell designs we like and we think would be easy to fit into an array, and compare them against each other based on how well they can scale up to the sound pressure loss that we need.
